

Invisible Invaders Sample Model

Humans aren't trash cans, but we have plastics in our bodies.

Piter Garcia + Aastha

Question: How does plastic break into tiny pieces, move through the environment and into living bodies, and how can we stop it fairly?

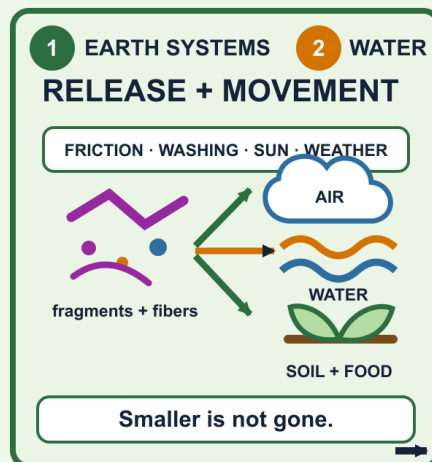

BEFORE

4. HUMAN INFRASTRUCTURE

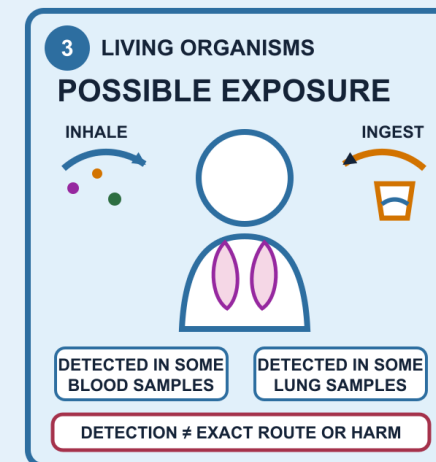

DURING

1. EARTH SYSTEMS + 2. WATER

AFTER

3. LIVING ORGANISMS

[SCIENCE] A product or material contains plastic. **Product design, manufacturing, purchasing, and use shape what can be released.**

Source: [NOAA - plastic and fragmentation](#)

[SCIENCE] Friction, washing, sunlight, heat, oxygen, and weathering can release fragments or fibers. Air, water, soil, food systems, buildings, and human activity can move them. **Smaller is not gone.**

Sources: [NOAA - fragmentation](#) | [WHO - water cycle](#)

[EVIDENCE] Inhalation and ingestion are possible routes. Plastic particles were detected in some blood and lung-tissue samples, but the studies do not identify every source or route and **do not prove a particular health effect.**

Sources: [blood study](#) | [lung study](#) | [FDA - evidence limits](#)

INJUSTICE [JUSTICE]

People do not have equal power over products, housing, work, transportation, food and water, waste systems, or safer alternatives. A fair investigation asks who benefits, who may carry exposure or cleanup burdens, whose knowledge counts, and who can change the system. **Youth and families should not be blamed for a system they do not control.**

WHAT CAN BE DONE [JUSTICE/ACTION + ACCESS]

Prevent release upstream; improve products and purchasing; monitor buildings and water/waste systems; and hold decision-makers accountable. **Campers choose one system point, a real decision-maker, and a fair evidence-matched request.** They may draw, point, build, write, speak, record, partner, use home language, or pass.
