

Field Friday: the 40-minute routine

Use this at the station. It contains the complete sequence, the protected decisions, and the reset steps.

ANCHOR: Humans aren't trash cans, but we have plastics in our bodies.

FRIDAY QUESTION: How can plastic move among or collect in sand, water, air, living things, and human systems even when we do not notice it at first?

0-3	Welcome + access preview	Show the whole sequence. Offer participation routes.
3-7	Fictional case	Name the story as a model immediately.
7-10	Demonstrate once	Predict → look → magnify → record → reset.
10-18	Durand model	One direction at a time. Record exact observations.
18-26	Ontario model	Repeat the same method. Keep pieces contained.
26-30	Match + reflect	Require two details and one model limit.
30-34	Choose sites	Select six safe, useful comparison locations.
34-38	Collect real sand	Frame → scoop → seal → label → map.
38-40	Wonder + close	Save exact youth questions for Monday.

Piter: agenda, fictional-case disclosure, demonstration, claim-evidence-limit discussion, and close.

Aastha: materials, timing, proactive support, exact youth language, labels, maps, and reset checks.

Protect these decisions

When time or energy drops, reduce repetition—not access, evidence limits, or traceability.

BEFORE CAMPERS ARRIVE

- Pilot two reference models and the matching mystery clue.
- Record the known answer and exact proxy counts.
- Place model materials, field jars, clean tools, and used tools in separate bins.
- Prelabel six pair jars and two backups.
- Confirm safe boundaries, timing, weather, and photo permissions.

AFTER EACH ROTATION

- Recover and count every prepared proxy piece.
- Reset the known model arrangement.
- Match field jar, lid, card, and map.
- Keep prepared models and real samples separate.
- Save exact youth questions and one access change.

SAY THIS CLEARLY

Case disclosure: "This is a model story, not a report of a real injured bird."

Evidence limit: "A visible field piece is suspected, not confirmed, plastic."

Close: "The model had a known answer. The beach does not."

NEVER CLAIM

- The reference models measure either beach.
- The fictional case explains animal illness.
- A visible field fragment is confirmed plastic.
- One observation proves a source, route, dose, or health effect.
- Young people or families are responsible for systems they do not control.

Field stop: No salt water at the beach. Never combine pair samples. Monday processing is per sample: SAMPLE → ADD BRINE → SETTLE → TRANSFER TOP LAYER → FILTER → COVER/DRY → INSPECT.
